AVL Tree

Definition

AVL Tree is:

- A Binary Search Tree,
- in which the heights of the left and right subtrees of the root differ by at most 1, and
- the left and right subtrees are again AVL trees.

Discovered by G.M.Adel'son-Vel'skii and E.M.Landis in 1962.

AVL Balance AVL Tree Operations

Splay Tree

Multiway Trees

B-Trees

A binary tree is an AVL Tree if

- Each node satisfies BST property: key of the node is greater than the key of each node in its left subtree and is smaller than or equals to the key of each node in its right subtree.
- Each node satisfies balanced tree
 property: the difference between the
 heights of the left subtree and right
 subtree of the node does not exceed one.

AVL Tree

Tree - Heap

Luu Quang Huan, MsC

Balance factor

- left_higher (LH): $H_L = H_R + 1$
- equal_height (EH): $H_L = H_R$
- right_higher (RH): $H_R = H_L + 1$

 $(H_L, H_R:$ the heights of left and right subtrees)

Why AVL Trees?

 When data elements are inserted in a BST in sorted order: 1, 2, 3, ... BST becomes a degenerate tree.
 Search operation takes O(n), which is inefficient.

- It is possible that after a number of insert and delete operations, a binary tree may become unbalanced and increase in height.
- AVL trees ensure that the complexity of search is $O(log_2n)$.

AVL Balance

Balancing Trees

- When we insert a node into a tree or delete a node from a tree, the resulting tree may be unbalanced.
 - \rightarrow rebalance the tree.
- Four unbalanced tree cases:
 - left of left: a subtree of a tree that is left high has also become left high;
 - right of right: a subtree of a tree that is right high has also become right high;
 - right of left: a subtree of a tree that is left high has become right high;
 - left of right: a subtree of a tree that is

AVL Delete Algorithm

The AVL delete follows the basic logic of the binary search tree delete with the addition of the logic to balance the tree. As with the insert logic, the balancing occurs as we back out of the tree.

Multiway Trees

- L.O.3.1 Depict the following concepts: binary tree, complete binary tree, balanced binary tree, AVL tree, multi-way tree, etc.
- **L.O.3.2** Describe the strorage structure for tree structures using pseudocode.
- L.O.3.3 List necessary methods supplied for tree structures, and describe them using pseudocode.
- L.O.3.4 Identify the importance of "blanced" feature in tree structures and give examples to demonstate it.
- L.O.3.5 Identity cases in which AVL tree and B-tree are unblanced, and demonstrate methods to resolve all the cases step-by-step using figures.

AVL Tree

AVL Tree Concepts

AVL Balance

AVL Tree Operations

Multiway Trees

- L.O.3.6 Implement binary tree and AVL tree using C/C++.
- L.O.3.7 Use binary tree and AVL tree to solve problems in real-life, especially related to searching techniques.
- L.O.3.8 Analyze the complexity and develop experiment (program) to evaluate methods supplied for tree structures.
- L.O.8.4 Develop recursive implementations for methods supplied for the following structures: list, tree, heap, searching, and graphs.
- L.O.1.2 Analyze algorithms and use Big-O notation to characterize the computational complexity of algorithms composed by using the following control structures: sequence, branching, and iteration (not recursion).

B-Trees

A B-tree is an m-way tree with the following additional properties $(m \ge 3)$:

- The root is either a leaf or has at least 2 subtrees.
- All other nodes have at least $\lceil m/2 \rceil 1$ entries.
- All leaf nodes are at the same level.
